

35kV busbar PT line disconnection fault phenomenon

Overview

The substation and SCADA system will issue signals such as “35kV busbar grounding” or “Arc Suppression Coil No. ” Relay protection does not trip but triggers alarm signals. The voltage of the faulted phase drops, while the other two phase voltages rise. Frequent fuse failures on the high-voltage side of bus potential transformers (PTs) significantly compromise the operational reliability and stability of these networks. However, existing research into the underlying failure mechanisms remains limited. 1 Accident Overview On March 17, 2023, a photovoltaic. The high magnitude fault currents require high-speed operation of the busbar protection to limit equipment. This article introduces a case of 35kV ring main unit busbar insulation breakdown failure, analyzes the failure causes and proposes solutions, providing reference for the construction and operation of new energy power stations.
