

Advantages and disadvantages of twisted-pair optical cables

Overview

Twisted pair cable is the most cost-effective choice for coaxial cables and optical fibers, but the bandwidth is also lower and the attenuation is higher, that is, the farther the distance, the worse the performance. They are also prone to wear and must be maintained regularly. It is the smallest amount expensive media of transmission for brief distances. If portion of a twisted pair cable is broken it doesn't effect the whole. Starting from the above five aspects, this article briefly summarizes the advantages and disadvantages of the three most commonly used cables, coaxial cable, twisted pair, and fiber optic cable. It has. Fragility: Optical fiber cables are fragile and can be damaged easily if they are bent or twisted too much. The copper wires are available with 1mm in diameter.
