

High-precision installation solution for Columbia fiber optic end-face electric cleaning pen

Article Overview

For high-precision cleaning of Columbia fiber optic end faces, using a combination of a precision polishing fixture and a solvent-based electric cleaning pen ensures optimal end-face quality and reliable optical performance.

Precision Polishing Fixture

A high-precision fiber array polishing fixture is essential for preparing fiber end faces before cleaning. Fixtures like the BFJIG-4PFA-SQFT allow quantitative control of pressure on the fiber array during polishing, ensuring uniform material removal and a smooth, defect-free end face. Key features include:

- 3-axis adjustable design for precise Z-axis pressure control and X/Y axis non-destructive clamping
- High reliability and consistency, suitable for most four-corner pressurized grinding machines
- Customizable polishing programs for different fiber array types, ensuring excellent end-face geometry and low insertion loss Using such a fixture before cleaning ensures that the fiber end face is flat, properly angled, and free of scratches or pits, which is critical for high-performance optical connections.
