

Myanmar Manufacturer Hot Aisle Rack Type

Article Overview

Hot aisle containment racks in Myanmar are available from specialized providers like Data Clean Asia, offering customizable, energy-efficient solutions for data centers.

Overview of Hot Aisle Containment

Hot aisle containment systems are designed to improve airflow management in data centers by separating hot exhaust air from cold supply air. This ensures consistent server inlet temperatures, reduces energy consumption, and prevents hot spots . The systems typically include:

- Vertical or horizontal containment panels made of aluminum frames with clear or frosted inserts .
- Rear partitions behind server racks connected to ceiling grids to channel hot air efficiently .
- Integrated cable tray support to reduce reliance on ceiling structures and simplify installation .

These systems can support loads up to 240 kg per meter and are designed for dust-free, clean installation environments . Partial containment panels, often 2 feet high, are used to stop hot air from mixing with cold aisles, enhancing CRAC unit efficiency and lowering energy costs .
