

OPGW Optical Cable Installation

Article Overview

OPGW cables are installed using a tension pay-off method on top of power line towers, with careful preparation, precise stringing, and specialized equipment to ensure mechanical and optical integrity.

Preparation and Planning

Before installation, a detailed engineering plan is essential. This includes reviewing design drawings, determining cable lengths, pre-reserved splice locations, and tower positions. The plan should account for environmental factors such as wind, ice, temperature variations, and lightning risks. Teams must inspect the site, verify tower stability, and ensure all tools and personnel are ready for the operation .

Equipment and Tools

Key equipment for OPGW installation includes tension machines, traction machines, pay-off machines, pulleys, anti-torsion devices, pre-stranding wires, cable grippers, theodolites, sag boards, and communication devices for coordination. Proper handling tools for cable drums are also required to prevent damage during transport and storage .

Cable Stringing and Tensioning

The tension pay-off method is commonly used. The cable is pulled from the drum and strung along the towers while maintaining appropriate tension to prevent sagging or abrasion. Anti-twisting devices and swivels are used to avoid fiber damage. The min...
