

Optical-to-electrical and electro-to-optical modules

Overview

Optical module is an optoelectronic device that performs optical-to-electrical and electro-optical conversion. Common optical modules include SFP, SFP+, SFF, and GE interface converter. The frequency response characterization of these electrical-to-optical (E/O, modulators sometimes integrated with lasers) and optical-to-electrical (O/E, photo detectors and receivers) converters can be important in terms of such parameters as bandwidth, flatness, phase linearity and group delay. The O2E can be customized to a wide range of wavelengths and is suitable for single mode and multimode applications. Our high performing O2E allows you to successfully test high baudrate. Operating at the physical layer of the Open Systems Interconnection (OSI) model, its function is deceptively simple but fundamentally vital: to act as the conversion interface between the electrical signals used by network equipment and the optical signals that travel through fiber optic cables. These O/E converters are ideal solutions for characterizing or troubleshooting high-speed optical signals in the system.
