

Preventive measures for relay protection deactivation

Overview

Preventive maintenance strategies for protective relays, including inspection, injection testing, TCC verification, and predictive diagnostics. Protective relays are designed for long service life, often operating reliably for 15–25 years or more. On such products, intensive testing is desired to prove its characteristics and to gain information about it. (ii) On relay types which have been used earlier, only minimum necessary checks should. Relion protection and control relays for several application reduce complexity. However, even the most advanced relay will. Facilities need to perform installation tests, implement preventive maintenance programs, and perform comprehensive commissioning tests to verify the integrity of both existing protective relay systems and new protection systems.
