

Price fluctuations of optical fiber cables

Article Overview

Optical fiber cable prices are currently rising and are likely to continue increasing in the near term due to structural demand growth, supply constraints, and rising input costs.

Current Price Trends

Since late 2025, global fiber optic prices have surged sharply. Standard single-mode G.652D fiber has increased between 45% and 80%, while bend-insensitive G.657A1 and high-performance G.657A2 fibers have reached approximately \$22/km and \$35/km, respectively, as of early 2026. This is not a typical cyclical fluctuation but a structural shift driven by multiple factors.

Key Drivers of Price Increases

1. Upstream Material Costs: The primary input, preform material, has become more expensive due to higher energy, chemical processing costs, and limited supplier concentration. Silicon tetrachloride and helium, essential for fiber production, have also risen sharply. 2. Supply Chain Constraints: Global logistics volatility, regional trade policies, and localized production shifts have tightened supply, particularly for high-performance fibers. 3. Demand Surge: Massive broadband deployment, hyperscale and AI data center expansion, and specialized applications like fiber-guided drones in military operations have created unprecedented demand, outpacing supply. 4. Structural Market Shifts: The market is experiencing a synchronized cost pressure across the entire fiber ecosystem, including patch cords, splitters, and distribution components
