

Secondary distribution box for construction in Brazil

Article Overview

Secondary distribution boxes in Brazil are essential for safely distributing three-phase electricity on construction sites, providing protection and modular installation under primary distribution systems.

Function and Role

A secondary distribution box (also called a second-level distribution box) is installed under the primary distribution cabinet and is responsible for distributing electricity to various power equipment on a construction site. It typically handles three-phase electricity and includes a large three-phase circuit breaker to protect connected equipment. These boxes are part of a three-level protection system for construction electricity, which ensures safety and compliance with construction standards .

Features and Design

- Inner and outer door design for safety and accessibility
 - Spray-painted exterior for durability and aesthetics
 - Rainproof top suitable for outdoor construction environments
 - Leakage protection measures to prevent electrical hazards
 - Copper busbars for reliable electrical contact
 - Measuring systems for monitoring voltage and current
- Secondary distribution boxes are designed to be modular and can be installed under the main distribution box, forming a complete system with switches and protection devices. This setup allows...
