

What are the mainstream fiber optic sensors

Overview

The optical fiber sensors are divided into two categories: thru-beam and reflective. The reflective type, which is a single unit, is available in 3 types: parallel, coaxial, and separate. This article will explore the principles behind fiber optic current sensors. The fiber optic sensor has an optical fiber connected to a light source to allow for detection in tight spaces or where a small profile is beneficial. These sensors are capable of measuring a wide range of physical and chemical parameters such as temperature, pressure, vibration, displacement. What is a Fiber Optic Sensor?

A fiber optic sensor measures a physical quantity by modulating the intensity, spectrum, phase, or polarization of light traveling through the optical fiber system. It's a device that converts light rays into electronic signals.
