

What is a normal signal strength dBm for an optical module

Overview

An Excellent/Ideal signal strength generally falls between -15 dBm and -25 dBm, though some systems may operate well up to -8 dBm. This range ensures the ONT receives a strong, clean signal without overwhelming the device's receiver. Optical loss is measured in "dB" which is a relative measurement, while absolute optical power is measured in "dBm," which is dB relative to 1mw optical power. Loss is a negative number (like -3.2 dB) while power measurements can be either positive (greater than the reference) or negative (less than. , The single-mode optical module has a receiving power range of -23 dBm to 0 dBm. Below is a detailed explanation of the specific. The decibel (dB) is a dimensionless logarithmic unit that expresses the ratio between two power levels. For longer distances, like 40 to 80+ km, 1550nm transceivers. Because optical power levels range widely, the decibel-milliwatt (dBm) is used instead of a linear unit like the milliwatt (mW).
