

What to do if the optical module clip is loose

Overview

Connection interruptions may occur due to unstable contact between the optical module and the main unit. Key Considerations: Preventing Problems Before They Occur 1. Dust prevention and cleaning: Details determine success or failure 1) Unused protection: When an optical module is not in. The following table lists common abnormal phenomena and solutions during the installation of optical modules: II. Vendor incompatibility. There are two primary reasons why an SFP module might become stuck in a port: The SFP is wedged in the cage: This can occur due to slight size variations, dirt or debris, or even heat expansion. A defective latching mechanism prevents proper release: This might happen if the latch handle is broken. After installing the optical module, insert the corresponding fiber jumper horizontally into the module (multimode fiber for multimode modules, single-mode fiber for single-mode modules). A slight "click" or tactile snap indicates the fiber is fully seated.
