

Where to connect the fiber optic cable

Article Overview

Fiber optic cables connect to an Optical Network Terminal (ONT), which converts light signals into data for your devices.

Fiber optic cables carry data as light pulses through thin strands of glass or plastic, allowing high-speed, long-distance transmission with minimal signal loss . In a typical home or business setup, the fiber cable is terminated at an Optical Network Terminal (ONT), which can be installed inside or outside the building . The ONT converts the optical signals into electrical signals that can be used by your network devices. From the ONT, an Ethernet cable usually connects to a router or gateway, distributing internet access to computers, smartphones, and other devices . In some setups, the ONT and router are combined into a single device, often called a combo unit, and for larger spaces, additional mesh Wi-Fi devices may be added to extend coverage. In summary, the fiber optic cable does not connect directly to your devices; it first terminates at the ONT, which acts as the interface between the optical network and your home or office network, ensuring that the high-speed light-based data can be used effectively by your electronics .
